

A lecture on the ULTY-V plus given at a meeting for exchanging coal-fired thermal power technologies between Japan and Vietnam

On February 25, we gave a lecture on the ULTY-V plus at a meeting for exchanging coal-fired thermal power technologies between Japan and Vietnam, at the request of JCOAL.

\* JCOAL continuously engages in the Project for International Promotion and Dissemination of Carbon Recycling and Advanced Thermal Power Generation Technologies, selected by NEDO.

The meeting had the following themes: 1) clean coal technology related to carbon neutrality in Japan and Vietnam; 2) exhaust gas and waste water dissemination simulation technology; and 3) introduction of the ULTY-V plus. It was attended by 9 companies from Japan and 4 companies from Vietnam, including EVN, a state-owned power group.

It was a precious opportunity for us to promote the ULTY-V plus toward future marketing in Vietnam, as participating companies recognized its excellent performance.

We will continue helping to create a sustainable society by promoting the ULTY-V plus overseas.
