

A lecture on the ULTY-V plus given at the 222nd Energy Conservation Committee meeting hosted by the Japan Boiler Association

On April 7, we gave a lecture on the ULTY-V plus at the 222nd Energy Conservation Committee meeting, at the request of the Japan Boiler Association.

* The Japan Boiler Association conducts studies and research, inspections and certifications, training and consulting, publishing, and PR activities on boilers and pressure vessels, while providing opportunities for technological exchanges, as well as reviewing and registering companies' quality management systems. It boasts over 6,000 members. The Association regularly holds Energy Conservation Committee meetings to devise energy-saving measures in line with global warming measures.

The lecture was given at both the venue and online to many people. The Q&A session after the lecture was so lively that it ran beyond the scheduled time. As a result, the Japan Boiler Association asked us to write a paper for a journal.

We will continue helping to create a sustainable society by developing and commercializing various energy-saving systems including the ULTY-V plus.
