

A lecture on BAIOMIX given at a seminar hosted by Technical Information Center

On August 25, we gave a lecture on BAIOMIX at the Businesses on Biomass Power Generation Fuel and Elements, Systems, and Equipment Technologies Including Mixed-Fuel Combustion seminar at the request of the Technical Information Center.

- * The Technical Information Center holds corporate seminars focusing on environmental and energy technologies mostly for engineers, researchers, and clerical staff members.

Amid the fast-growing global trend toward achieving carbon neutrality, the transition of thermal power generation from fossil fuel to woody biomass or pellet fuel has progressed in Japan. This lecture explained the outline and features of BAIOMIX, a system we developed to optimize the mixed combustion ratio of biomass fuel. About 20 companies participated, either at the venue or online.

The audience asked various questions, which was a great opportunity for us to promote BAIOMIX in Japan and future marketing overseas.

We will continue helping to create a sustainable society by developing products that meet customer needs.
